

The image shows the front cover of a booklet titled 'Diabetic Eye Screening'. The title is at the top in large white text on a green background. Below it is the subtitle 'What you need to know' in smaller white text. The main image on the cover is a close-up of two blue eyes. A white rectangular box highlights the right eye, with a small white crosshair icon in the center of the eye. At the bottom of the cover is the logo for the 'Northern Ireland Diabetic Eye Screening Programme', which consists of a circular graphic divided into four colored segments (blue, green, yellow, red) and the text 'Northern Ireland Diabetic Eye Screening Programme'.

Diabetic retinopathy occurs when diabetes damages the small blood vessels in the part of the eye called the retina. These blood vessels can become blocked or leaky, affecting how the retina works. Sometimes abnormal new blood vessels grow, which are weak and can bleed easily.

In the early stages, these changes will not normally affect your sight. However, if left untreated, the retinopathy may get worse and your vision may be affected.

People with diabetes are invited to attend the Diabetic Eye Screening Programme and the 'What you need to know' leaflet is sent with the invitation. The screening service is free and part of their overall diabetes care.

The shorter 'Introduction' leaflet is distributed to all endocrine/diabetes clinics and ophthalmology clinics across the five Trusts, as well as GP surgeries. This provides introductory information for patients recently diagnosed with diabetes.

There is also a leaflet to inform health professionals about all aspects of the screening programme; a leaflet on digital photography surveillance for those who need closer monitoring; a flyer for patients who need to receive eye drops during the screening appointment; and a flyer on slit lamp examination for those for whom standard digital photography did not provide a good enough picture of the back of the eyes. A leaflet on the 'low-risk pathway' is also included for those who can move to screening every two years.
