

Blood-borne viruses and STIs surveillance

Last reviewed
19 June 2026

The blood-borne viruses and sexually transmitted infections (STIs) team is responsible for surveillance and control activities for hepatitis B, hepatitis C, HIV, syphilis, chlamydia and other sexually transmitted infections. As these are all largely preventable by avoiding risks, and in the case of hepatitis B, by vaccination, we work with a wide range of partners to reduce the numbers of people infected and ensure good treatment.

The multi-disciplinary team includes doctors, nurses and information officers. Some of the activities of the team include:

- Contributing to surveillance of blood-borne infections and STIs
- Ensuring actions are taken to prevent infections, working with a range of other healthcare professionals and voluntary groups
- Following up notified cases of hepatitis to reduce onward transmission
- Organising and contributing to education activities
- Preparation of annual reports
- Management of incidents and outbreaks
- Chairing and contributing to work of Hepatitis B and C Managed Clinical Network [Northern Ireland Hepatitis B & C Managed Clinical Network](#)

The most comprehensive source of data on sexually transmitted infections (STIs) is provided by the Sexual Health and HIV services in Northern Ireland.

Surveillance data and reports:

HIV/AIDS

Surveillance arrangements for HIV/AIDS infection are based largely on the confidential reporting of HIV infected individuals to the UK Health Security Agency

(UKHSA).
