GP consultation rates for ‘flu/flu-like-illness’ (‘flu/FLI’)
(Wk 42: 14 — 20 Oct 2019)
(Wk 43: 21 — 27 Oct 2019)

Number of hospital cases with confirmed flu
(14 — 27 Oct 2019)

Circulating strains this season to date

Respiratory Outbreaks
(14 — 27 Oct 2019)

To date there have been no flu outbreaks reported

Influenza vaccine uptake 2019-20

Vaccine uptake rates for 2019-20 will appear here later in the season.

Annual Influenza Surveillance Report 2018-19

The end of season report, Surveillance of Influenza in Northern Ireland 2018-19 is now available to download here.
GP consultation rates for ‘flu/flu-like-illness’ (‘flu/FLI’)

![Graph showing flu/FLI consultation rates]

**Figure 1. Northern Ireland GP consultation rates for ‘flu/FLI’ 2018/19 – 2019/20, 2010/11 for comparison**

The baseline MEM threshold for Northern Ireland is 14.7 per 100,000 population for 2019-20. Low activity is 14.7 to <23.9, moderate activity 23.9 to <73.9, high activity 73.9 to <121.7 and very high activity is >121.7

**Comment**

GP flu/FLI consultation rates were 4.6 per 100,000 population in week 42 and 5.1 per 100,000 in week 43, which is higher than the same time last year (3.8 and 3.6 per 100,000, respectively). Activity remains below the baseline threshold for Northern Ireland (<14.7 per 100,000) (Figure 1).

Flu/FLI consultation rates were highest in 45-64 year olds in weeks 42 and 43 (6.2 and 7.1 per 100,000 population, respectively). Rates are higher in all age groups, except 0-4 and 5-14 year olds, compared to the same period last year (week 43, 2018-19).
Figure 2. Northern Ireland Out of Hours (OOH) consultation rates for ‘flu/FLI’ 2018/19 – 2019/20

Comment

Flu/FLI consultation rates in Primary Care Out-of-Hours (OOH) Centres were similar in both weeks 42 and 43 (3.4 and 3.5 per 100,000 population, respectively). This is slightly higher than the same period last year (2.2 per 100,000 population in week 43, 2018-19) (Figure 2).

In weeks 42 and 43 the percentage of calls to an OOH Centre due to flu/FLI was similar (0.6% and 0.7%, respectively). This is similar to the same period last year (0.5%).

Rates were highest in those aged 0-4 years in both weeks 42 and 43, 9.6 and 12.3 per 100,000 population, respectively. In comparison to week 43, 2018-19, consultation rates were higher in all age groups, with the exception of 5-14 and 45-64 year olds.
Figure 3. Weekly number of flu laboratory reports from week 40, 2018 with weekly GP consultation rates for ‘flu/FLI’
Note
All virology data are provisional. The virology figures for previous weeks included in this or future bulletins are updated with data from laboratory returns received after the production of the last bulletin. The current bulletin reflects the most up-to-date information available. Sentinel and non-sentinel samples are tested for influenza and for RSV. Cumulative reports of influenza A (untyped) may vary from week to week as these may be subsequently typed in later reports.
In weeks 42 and 43, 22 samples were positive for flu (16 Flu A(H3), two Flu A(H1N1), one Flu A(Untyped) and three Flu B) from 563 submitted for testing in laboratories across Northern Ireland.

Overall positivity of 4% is higher than this time last year (1%).

Seven of the 18 samples submitted by the GP based sentinel scheme were positive for flu (six Flu A(H3) and one Flu B) (Figures 3 and 4; Tables 1, 2 and 3).
Respiratory Syncytial Virus (RSV)

**Figure 5. Number of samples tested for RSV and proportion positive, 2018/19 – 2019/20, all sources**

**Comment**

In weeks 42 and 43, 90 samples were positive for RSV, with overall positivity in week 43 (16%) higher than the same period last season (3%).

The majority (82%) of cases since week 40 have occurred in children aged 0-4 years (Table 2 and Figure 5).
Hospital Surveillance (Non-ICU/HDU)

Figure 6. Weekly number of hospitalisations testing positive for influenza by week of specimen, 2018/19 – 2019/20

Comment

In weeks 42 and 43, 15 hospitalisations tested positive for flu (10 Flu A(H3), two Flu A(H1N1), one Flu A(Untyped) and two Flu B). This is an increase compared to the same time last year (Figure 6).

Of note, not all positive specimens may have been reported as this point.
ICU/HDU Surveillance

![Graph showing confirmed ICU/HDU influenza cases by week of specimen, 2018/19 – 2019/20](image)

**Figure 7. Confirmed ICU/HDU influenza cases by week of specimen, 2018/19 – 2019/20**

**Comment**

Data are collected on laboratory confirmed influenza patients and deaths in critical care (level 2 and level 3). There were no new admissions to ICU with confirmed influenza reported to the Public Health Agency (PHA) during weeks 42 and 43. So far this season there has been one admission to ICU with confirmed influenza (Flu A(H3)) reported to the PHA (Figure 7).

Summary information on cases will be reported in the bulletin only if the numbers do not risk data confidentiality.

**Outbreaks**

There have been no confirmed respiratory outbreaks reported to the PHA Health Protection acute response duty room so far this season.
Mortality

The Northern Ireland Statistics and Research Agency (NISRA) provide the weekly number of respiratory associated deaths and its proportion of all-cause registered deaths.

**Respiratory associated deaths** include those that are attributable to influenza, other respiratory infections or their complications. This includes “bronchiolitis, bronchitis, influenza or pneumonia” keywords recorded on the death certificate.

![Graph showing weekly registered deaths and proportion of all deaths with keywords](image)

**Figure 8. Weekly registered deaths and proportion of all deaths with keywords, by week of registration from week 40, 2018**

**Comment**

In week 43, 64 respiratory associated deaths out of 279 all-cause deaths were reported (23%), with 28% in week 42. These trends are broadly the same as the same period in 2018/19 (Figure 8).
There was no excess all-cause mortality reported in Northern Ireland in weeks 42 and 43.

Please note this data is provisional due to the time delay in registration; numbers may vary from week to week.

Information on mortality from all causes is provided for management purpose from Public Health England. Excess mortality is defined as a statistically significant increase in the number of deaths reported over the expected number for a given point in time. This calculation allows for a weekly variation in the number of deaths registered and takes account of deaths registered retrospectively. Information is used to provide an early warning to the health service of any seasonal increases in mortality to allow further investigation of excess detections.

There is no single cause of ‘additional’ deaths in the winter months but they are often attributed in part to cold weather (e.g. directly from falls, fractures, road traffic accidents), through worsening of chronic medical conditions e.g. heart and respiratory complaints and through respiratory infections including influenza.

For more information on EuroMOMO and interactive maps of reporting across the season please see [http://www.euromomo.eu/index.html](http://www.euromomo.eu/index.html)

### Influenza Vaccine Uptake

Vaccine uptake rates for 2019-20 will be reported in the bulletin later in the season. Uptake rates for the previous two seasons are shown below.

Further Information and International/National Updates

**Further information**
Further information on influenza is available at the following websites:

- [PHA Seasonal Influenza](#)
- [nidirect Flu Vaccination](#)
- [PHE Seasonal Influenza Guidance - Data and Analysis](#)
- [WHO Influenza](#)
- [ECDC Seasonal Influenza](#)

**National updates**
Detailed influenza weekly reports can be found at the following websites:

- England [PHE Weekly National Flu Report](#)
- Scotland [HPS Weekly National Seasonal Respiratory Report](#)
- Wales [Public Health Wales Influenza Surveillance Report](#)
- Republic of Ireland [HPSC Seasonal Influenza Surveillance Reports](#)

**International updates**

- Europe (ECDC and WHO) [Flu News Europe](#)
- Worldwide (WHO) [WHO Influenza Surveillance Monitoring](#)
- USA (CDC) [Weekly U.S. Influenza Surveillance Report](#)
Acknowledgements

We would like to extend our thanks to all those who assist us in the surveillance of influenza in particular the sentinel GPs, Out-of-Hours Centres, Apollo Medical, Regional Virus Laboratory, Critical Care Network for Northern Ireland and Public Health England. Their work is greatly appreciated and their support vital in the production of this bulletin.

The author also acknowledges the Northern Ireland Statistics and Research Agency (NISRA) and the General Register Office Northern Ireland (GRONI) for the supply of data used in this publication. NISRA and GRONI do not accept responsibility for any alteration or manipulation of data once it has been provided.

For further information on the Enhanced Surveillance of Influenza in Northern Ireland scheme or to be added to the circulation list for this bulletin please contact:
