Weaning made easy

As a parent you want the best start for your baby. What your child eats and drinks is important for his/her health now and in the future.

The information in this leaflet may be quite different from what you have read before, or what your friends or family may tell you they did. New research is constantly being carried out into infant nutrition and the information and advice in this leaflet is based on up-to-date scientific evidence. It will help you make sure that your child is getting a good start. The questions and answers that follow should explain why this advice is being offered.

Weaning can be an exciting and sometimes daunting time for parents as they introduce their baby to the world of solid food. This leaflet will help guide you through this developmental stage and encourage you to introduce a range of tastes and textures to your baby.

What's the best time to introduce solid foods?

Research shows that babies don't need anything but breastmilk or infant formula for the first six months of life.

This is because babies' digestive systems and kidneys are still developing. Introducing solids too soon may increase the risk of asthma, eczema, digestive problems, allergies and obesity in later life.

Why wait until 6 months?

The advice to wait until about six months is in line with research and endorsed by the World Health Organization and the Department of Health. You may not see an immediate difference in your child's health, compared to other babies that are weaned earlier, but you can be confident that you are giving your child the best chance to have good health throughout their life.

If you have a baby who suffers with severe reflux, faltering growth or is at a higher risk of developing allergies you may be advised by a health professional to introduce solid food earlier. Please seek advice from paediatrician or paediatric dietitian on safe weaning practice at this age.

If your baby was born prematurely, ask your paediatrician, health visitor or paediatric dietitian for advice about what is best for your baby.

Signs your baby is ready for solid food

Every baby is different but around 6 months of age there are three clear signs that together show your baby is ready for some solid foods alongside breastmilk or infant formula:

1. Baby can stay in a sitting position and hold his head steady.
2. Baby can coordinate his/her eyes, hands and mouth so that he can look at the food, pick it up and put it in his/her mouth all by himself.
3. Baby can swallow food (a baby who is not ready will push food back out of his mouth).

The following behaviours can be **mistaken** for signs of readiness:

- chewing their fists
- waking up (more than usual) in the night
- wanting extra milk.

These are all normal behaviours for babies and **not necessarily** a sign that they are ready to start solid food. Starting solid foods will not make your baby more likely to sleep through the night; sometimes a little extra milk might help.

My baby was 4.5kg (10lb) at birth – won't he need solid food earlier?

It doesn't really matter what weight your baby was at birth – his/her digestive system and kidneys will still develop at the same rate as a smaller baby. There's no need to introduce solid food earlier just because she weighs more. Wait for the above signs of readiness for solid foods at about six months of age.

My 5 month old baby seems very hungry – surely she needs to start on solids now?

The most common reasons mothers give for starting weaning early are that their baby seemed especially hungry or had begun waking up at night again after a period of sleeping through. Babies have several growth spurts in the first few months when they need more calories and nutrients than usual. This doesn't mean they need to start on solid food – extra breast or formula milk will be adequate to meet these needs. Growth spurts don't usually last very long and babies generally settle down again afterwards. Research has also shown that introducing solid food has little impact on how long a baby sleeps or how often they wake up during the night.

Hints for successful weaning

Preparing for weaning: useful items

- highchair
- bibs
- first cup
- plastic spoons
- ice cube trays
- small bowls
- messy mat or newspaper for the floor

<https://www.nhs.uk/start4life/weaning/getting-ready/>

- Allow plenty of time for feeding, particularly at first. Until now your baby has only known food that comes in a continuous flow from a nipple or teat. Your baby needs to learn to move solid food from the front of the tongue to the back in order to swallow it. The food tastes and feels different – it's bound to take time. Choose a time of day when you are both relaxed.
- Make sure everything you use for feeding your baby is really clean (if you have decided to wean before your baby is 6 months old then, where possible, equipment should also be sterilised). Put a small amount of food in a suitable container and heat this, rather than heating a large amount that may go to waste. You can always heat up more if it is needed. Heat food thoroughly and allow it to cool, stir well and test before offering it to your baby. This is especially important if you are using a microwave. Throw away any food your baby hasn't eaten as it is not safe to reheat previously reheated food.
- Do not rush or 'force feed'. Most babies know when they've had enough to eat. Don't spend a lot of time persuading your baby to take food – they soon learn that refusing food is a good way of getting attention, or of getting a sugary pudding instead of a savoury course. Of course it's right to give attention, chat and enjoy meals together, but when food is refused it might be best to call an end to the meal.

- When your baby shows an interest in feeding him or herself, this is a good sign. Encourage this by giving your baby a spoon and helping him/her to load it with food. It'll take a while for your baby to get the hang of this, so you can keep offering food from another spoon in the meantime.

- Bought weaning foods can be useful, but don't let them replace your own cooking. Try to use packets, tins or jars as little as possible and make sure you follow the instructions carefully. Family foods offer a greater range of tastes and textures, and will help to get your baby used to the taste of home-made meals. They're also less expensive and you know exactly what the ingredients are.
- Mashed foods can be frozen in a covered ice cube tray in the freezer. One or two cubes can then be defrosted as required. As your baby begins to eat more, you may find plastic food tubs with lids useful for freezing larger amounts of food.
- By the age of one you want your baby to be eating a variety of foods and to have adapted to your pattern of eating – three meals a day with a drink at each meal and two or three additional snacks. Offering a wide variety of foods at this stage will encourage your child to eat a varied, balanced diet.

Cautions

- Always stay with your baby when he/she is eating to make sure he/she doesn't choke.
- Never add any foods to your baby's bottle (this includes rusks) as this can cause choking and can damage teeth.

Getting started – from 6 months

This advice is appropriate if you are weaning your baby at about 6 months. If you are thinking of weaning earlier than this, remember that health experts agree that weaning at around 6 months is the healthiest option for all babies. If you still want to wean your baby early, follow the separate advice on page 22 to minimise the risks.

By the age of 6 months your baby needs more than just breastmilk or infant formula. The idea of weaning is to introduce your baby gradually to a wider range of foods and textures, so that by the age of 1 year your baby will be joining in family meals. All babies are different. Some take to it quickly, some take longer. It can take up to 10 attempts for some babies to get used to new foods, flavours and textures.

There is no best time of day to offer first solid foods – choose a quiet time when your baby isn't too hungry. Offer a small amount of food before or after a milk feed, or in the middle of the feed if that works better. Remember that not all food needs to be given on a spoon. Your baby can feed themselves using their hands as soon as they show an interest in food. See pages 10 and 11 for more information on finger foods.

Don't be surprised if your baby doesn't want the solid food at first – this is perfectly normal. Wait until the next mealtime and try again. The amount of food your baby will eat will depend on their appetite. Let your baby guide you and never force your baby to eat.

There will be days when they eat more, some when they eat less, and then days when they reject everything. The main aim at this stage is to get your baby used to experiencing different tastes and textures. If you are using a spoon, wait for your baby to open their mouth before you offer food. Start off by offering just a few teaspoons of food once a day. Your baby may like to hold a spoon too as they often copy their parents and other children. Continue to give your baby the usual amount of breastmilk or infant formula, as most of the nourishment he/she needs will still be coming from it during this early stage of weaning.

Suitable first foods to try from 6 months:

- soft cooked carrot, parsnip, potato, turnip in sticks or cauliflower and broccoli florets or well mashed for a spoon feed;
- banana, avocado, soft pear, tinned peaches or apricots in pieces baby can hold or well mashed;
- unsweetened custard (made using custard powder);
- plain/natural yogurt;
- plain baby rice mixed with baby's usual milk.

Above: A floret of cooked broccoli

Below: Stewed apple

Introducing potential allergens

It's important to introduce foods that can trigger allergic reactions from six months as this can reduce the risk of allergy. Introduce these foods one at a time, in very small amounts, so that you can spot any reaction:

- cows' milk (in cooking or mixed with food)
- eggs (eggs without a red lion stamp should not be eaten raw or lightly cooked)
- foods that contain gluten, including wheat, barley and rye
- nuts and peanuts (serve them crushed or ground)*
- seeds (serve them crushed or ground)
- soya
- shellfish (don't serve raw or lightly cooked)
- fish

Once introduced and if tolerated, keep offering those foods as part of your baby's usual diet (to minimise the risk of allergy). Read more at www.nhs.uk/start4life/weaning/safe-weaning/food-allergies/#anchor-tabs food allergies and what signs to look out for.

Above: Well mashed carrot

Below: Well mashed potato

Weaning foods should not contain salt or sugar.

At first your baby may be content with small amounts of food for example, only 1–2 teaspoons of mashed food. Use a plastic weaning spoon and half fill it. As your baby learns to take food from a spoon, you will need to increase the amount of solid food you offer. At the same time you will increase the number of times you offer solid foods each day to 2 and then 3 occasions, whether these are finger foods or spoon feeds.

Pasteurised whole cows' milk can be used to mix into foods such as mashed potato and breakfast cereal, but should not be given as a main drink until after 1 year.

Foods to avoid giving your baby

- **Salt.** Do not add any salt to foods for babies as their kidneys are not fully developed. When you're cooking for the family, leave out the salt so your baby can share family meals. You should also avoid foods that contain a lot of salt, eg packet soups, stock cubes, crisps, bacon, smoked meats.
- **Sugar.** Do not add sugar to the food or drinks you give your baby. Sugar could encourage a sweet tooth and lead to tooth decay when the first teeth start to come through.
- **Honey.** Don't give honey before your child is 1 year old, even for easing coughs. Honey can contain a type of bacteria which can produce toxins in the baby's intestines and can cause a very serious illness (infant botulism). After the age of 1, the baby's intestine matures and the bacteria are not able to grow, but bear in mind that honey is also a sugar and can cause the same problems, such as tooth decay.
- **Whole nuts.*** Whole nuts of any kind are unsuitable for children under the age of 5 years because of the risk of choking.

*Products containing nuts for example peanut butter are safe, for most children. If there is a history of conditions such as asthma, eczema or hay fever in the family (ie parents, brothers or sisters), speak to your GP, health visitor or medical allergy specialist before giving nut-based products to your baby for the first time.

Moving on – after the first couple of weeks

As your baby gets used to the first foods, begin to add different foods to allow your baby to try lots of different tastes and textures. You'll be able to use lots of the foods you already cook for yourself, for example:

- mashed or minced meat or chicken;
 - fish, eg cod (with bones removed), tuna, sardines (well mashed);
 - mashed lentils (dahl) or split pulses, hummus;
 - mashed hard boiled egg;
 - smooth nut butter, for example, peanut butter (see note about nuts, page 8);
 - foods made from wheat, eg bread, pasta, semolina;
 - breakfast cereals, such as plain Ready Brek, Weetabix, porridge.
- } *serve with mashed potatoes, rice or pasta and sticks of cooked vegetables*

If you are weaning your child onto a vegetarian diet, see also page 18 for additional suggestions.

Whether your baby is having breastmilk or infant formula, you can introduce a small cup of tap water at mealtimes from 6 months. You may find that your baby only manages small amounts initially, but this is a good start. The earlier a cup is introduced, the quicker he/she will adapt to using it. Use an open cup, or a free-flow cup without a valve as this will help your baby learn to sip and is better for their teeth.

Iron

Try to give your baby a variety of foods rich in iron every day, eg beef, pork, lamb, sardines, egg yolk, green vegetables, beans, peas, lentils, fortified breakfast cereals.

Vitamin C helps the body absorb iron so it is important to include some foods rich in vitamin C at mealtimes. Vitamin C is found in fresh fruit, eg oranges and strawberries, and vegetables such as red and green peppers, tomatoes and broccoli. This is particularly important if you are weaning your baby onto a vegetarian diet.

Finger foods and lumps

Encourage your baby to chew by giving them a wide variety of textures, which should include finger foods and soft lumps in mashed foods.

Most babies can start to chew soft lumps from 6 months even if they have no teeth, such as mashed baked beans, no added sugar rice pudding or minced or finely chopped meat.

Babies are able to cope better with lumps if they are introduced early. This is really important for the development of speech muscles.

Finger foods provide chewing practice and encourage babies to feed themselves. These can be given from 6 months. Suitable finger foods include toast, bread, pitta bread or chapatti, peeled apple, banana, raw or cooked green beans, cooked carrot sticks or sticks of cheese. Avoid biscuits and rusks so that your baby does not get into the habit of expecting sweet snacks. Even low-sugar rusks contain sugar.

This may seem like you're moving on quite quickly, but you'll be surprised at how fast your baby can progress – this is one of the benefits of waiting till six months to start weaning. Some mothers worry about their babies choking on lumps, but in fact a baby is more likely to choke on liquid than food, so as long as you always supervise your baby eating, there's no need to be concerned.

If you delay giving 'lumpy' or finger foods, you may find that your baby refuses to eat 'lumpy' foods as they get older.

Always stay with your baby during feeding to give encouragement and to make sure he/she doesn't choke.

To reduce the risk of choking, cut up smaller fruits and vegetables like grapes and cherry tomatoes, remove any stones and pips and cut large fruits into smaller pieces

Gagging is a normal reflex as your baby learns to chew and swallow solid foods. Gagging is loud. Your child's skin may also look red when they're gagging, but redness can be harder to see on brown and black skin. Choking is quiet. If your child has white skin, it may begin to look blue (cyanosis) when they're choking. If they have brown or black skin, their gums, inside their lips, or their fingernails may begin to look blue. For further information, see www.nhs.uk/start4life/weaning/safe-weaning/choking/#anchor-tabs

From about 7 months

From about 7 months you can just use a fork to mash the food. By this stage your baby should be having 3 meals a day. It will be a mixture of fork mashed foods, spoon feeds and finger foods.

You will find that as your baby eats more solid food, his/her milk intake will start to decrease. Continue to breast-feed on demand or if you formula feed your baby offer 500-600ml (16-20 fl oz) a day. Try to follow your baby's appetite and go at your baby's pace.

The texture of spoon feeds from about 7 months

Above: Minced beef

Above: Mashed peas

About teeth

It's never too early to protect your baby's teeth.

- Begin to brush baby teeth twice a day (last thing at night and on one other occasion) every day as soon as they appear in the mouth, using a small smear of fluoridated toothpaste. For children 0 to 3 years old use a fluoridated toothpaste containing more than 1,000 ppm (parts per million) of fluoride.
- Don't offer food and drinks that are high in sugar between meals.
- From six months babies should be introduced to drinking from a free-flow cup. By the age of 1 your child should no longer be drinking from a bottle.
- Sugar should not be added to weaning foods or drinks.
- Parents/carers should clean their baby's teeth but letting the baby have their own toothbrush as well can help make it fun.

Register your baby with a dentist from the time the first tooth erupts (about 6 months of age) and continue to take them for dental examinations as regularly as your dentist recommends.

From 9 months

At this stage your baby will move on from mashed to chopped foods. Remember that babies need fat for the concentrated calories it provides – you should not be applying adult healthy eating guidelines to your baby's diet. Continue to breastfeed on demand or give about 500-600ml (16-20 fl oz) of infant formula milk each day. Other than milk, water is the best drink to choose. Learning to sip water is a new skill and better (than sucking from a bottle) for your baby's teeth. Encourage your baby to eat a wide variety of foods. By eating as a family your baby can learn to enjoy mealtimes.

Some meal ideas to try

Breakfast:

- unsweetened breakfast cereal with whole cows' milk;
- toast with egg – scrambled, poached or boiled.

Lunch:

- baked beans with fingers of toast;
- sandwiches filled with tuna, chopped chicken or ham;
- soup with a toasted sandwich;
- pasta shapes in tomato sauce with grated cheese, served with crusty bread;
- homemade pizza with chopped fresh tomato and sweetcorn.

Dinner:

- minced or chopped meat, mashed potatoes and carrots;
- fish fingers, peas and mashed potatoes;
- chicken casserole and rice;
- lasagne with broccoli;
- vegetable risotto with grated cheese;
- beef burgers or lentil burgers, courgettes, tomato slices and boiled potatoes;
- cauliflower cheese, boiled potatoes and green beans.

Dessert:

- pieces of fresh soft fruit, eg pear, banana, melon;
- stewed fruit, eg apples, apricots, prunes (with stones removed);
- tinned soft fruit in its own juice, eg strawberries, peaches, pears;
- milk pudding, yogurt or fromage frais (do not use 'diet' varieties).

Snacks between meals

Foods and drinks high in sugar, eg sweets, cream or chocolate biscuits, pancakes, Danish pastries, brioches and juices, are most damaging to teeth when they are taken between meals. This doesn't mean that they should never be taken, but they are less damaging to teeth if they are taken at the end of meals.

Ideas for healthy snacks between meal include:

- chopped fruit and vegetables, eg peeled apple, pear, strawberry, peach, banana, orange, carrot, cucumber;
- Bread-based snacks such as white or wholemeal rolls, toast, bagels, soda or potato bread, plain breadsticks or crackers or a small sandwich with a sugar-free filling such as tomato, tuna, chicken or cheese.
- natural yogurt or
- plain fromage frais – add your own fruit for extra flavour;
-
- cheese.

Sugar-sweetened snacks and drinks should be avoided between meals and especially at bedtime.

Weaning at a glance

At 6 months

- This is the time to start weaning.
- Start off with a small amount of well mashed or finger foods.
- Continue to give the usual amount of breastmilk or infant formula.

After a couple of weeks:

- Begin to add in other foods to allow your baby to experience different tastes and textures.
- You can start to leave a few soft lumps in any spoon feeds that you offer.
- Increase to 2 or 3 meals a day.
- Remember to continue to encourage a cup for water at meal/snack times.

About 7 months

- Just use a fork to mash foods.
- By this stage you should be giving 3 meals a day and your baby should be eating more at each feed.
- Once your baby is on 3 meals a day, he or she will naturally reduce the amount of breastmilk they want; continue to breastfeed on demand. If you are giving formula milk, reduce the amount you give to at least 500-600ml (16-20fl oz) a day.

From 9 months

- Continue to give 3 meals a day plus snacks.
- Move on from mashed to chopped foods.
- Offer your baby a wide variety of foods.
- Continue to breastfeed on demand or give at least 500-600ml (16-20 fl oz) of formula milk.

What about drinks?

Breastmilk

Breastmilk is the ideal drink for babies. It is recommended to breastfeed exclusively for the first six months and then continue with demand breastfeeding as solid food is introduced. Your child will naturally reduce the amount of breastmilk taken as more food is eaten.

Formula milk

This is the only alternative to breastmilk in the first 12 months of your baby's life. It can be used up to the time when full fat cows' milk can be introduced at one year old.

Follow-on formula

This is not necessary and is unsuitable for infants under 6 months.

Cows' milk

Whole cows' milk should not be used as the main drink until 1 year. If your child is eating a varied diet, semi-skimmed milk may be given from 2 years. Skimmed milk should not be given to children under 5 years. However, remember that whole cows' milk can be added to foods, for example breakfast cereals, from 6 months.

Water

From six months, tap water can be offered to your baby in a cup at meal and snack times. There is no need to offer breastfed babies water before 6 months but if for some reason water is given before 6 months it should be boiled and cooled.

Drinks that are not recommended

Baby juices, baby herbal drinks

These contain sugar and can damage developing teeth if they are used frequently or given from a bottle.

Sugary diluting squashes

These contain sugar and can damage developing teeth. If used, they should be very well diluted and given from a cup.

Drinks that should not be given

Colas, lemonades and fizzy drinks including 'diet' drinks and sugar-free squashes

Sugary and sugar-free versions of these drinks are acidic and can cause damage to teeth. 'Diet' drinks and sugar-free squashes are also high in artificial sweeteners which are unsuitable for babies and children.

Tea and coffee

These reduce the amount of iron the body absorbs from food and they contain caffeine, which is not suitable for babies and children.

Bottled waters

These may contain high levels of minerals which make them unsuitable for babies.

Goats' and sheep's milk

These milks lack essential vitamins and minerals needed for babies' growth and development.

Rice drinks

Young children (aged one to five years) should not be given rice drinks in order to minimise their exposure to inorganic arsenic.

Alternatives to cows' milk

Unsweetened calcium-fortified milk alternatives such as soya drinks and other milk alternatives like almond and oat drinks can be given from the age of one as part of a healthy balanced diet. Only use soya-based infant formulas on the advice of your GP.

See *Birth to Five* on www.publichealth.hscni.net/publications

Weaning on to a vegetarian or vegan diet

Weaning your baby on to a vegetarian diet means you will need to take extra care to make sure your baby gets all the protein, vitamins, iron and other minerals needed.

Vegan mothers who are breastfeeding must ensure that they take an adequate amount of vitamin B12 supplement, as requirements increase during pregnancy and breastfeeding. You can obtain further information and advice from your health professional or www.firststepsnutrition.org/eating-well-early-years

You can continue to breastfeed your baby for as long as you want. Babies who are being weaned on a vegetarian or vegan diet should be given breastmilk on demand or suitable infant formula until they are 1 year old. From the age of 1 year, infants who are being given a vegan diet should be given breastmilk or an unsweetened calcium enriched cows' milk alternative, such as soya or oat milk (check the label to make sure it contains at least 120mg of calcium per 100g) and the appropriate vitamin supplementation (see page 21). Low fat products are not advised for those children following a vegan diet. From 1 year drinks other than breastmilk should be given from a cup.

Alternatives for meat, chicken and fish

Some of the alternatives listed below should be included every day:

- mashed pulses such as lentils, peas, beans, eg red lentils, chick peas(if you decide to wean before 6 months these are the **only** foods from this list that can be used);
- tahini – sesame seed paste;
- finely ground nuts (unless there is a family history of allergy – see note about nuts page 8);
- eggs - scrambled, hard boiled, poached etc.
- tofu;
- soya protein (TVP);
- mashed/minced quorn.

Vitamin C helps the body absorb iron from these foods so it is important to include fruit and vegetables at every meal.

Fussy eaters

It is quite normal for a baby to refuse food occasionally. Below are some suggestions on how to cope with a fussy eater.

- Avoid frequent snacks between meals and ensure that your baby is not drinking continually throughout the day – both of these can reduce your baby's appetite for main meals.
- Keep to regular mealtimes – children need routine.
- Keep portions small – babies cannot eat large amounts of food at a time.
- Don't become anxious if your baby refuses food – just clear away the food calmly and dispose of it. Don't offer an alternative – just wait until the next meal or snack.
- If a food is refused, try it again a few days later – it may take several attempts before your baby will accept it.
- Make sure there are no distractions, eg toys, television.
- Never force your baby to eat.

For most children this will be a passing phase, so try not to worry unnecessarily. However, if you're really worried about your child's eating habits, for example if they are losing weight, talk to your GP or health visitor, or ask to see a registered dietitian.

Vitamin supplements

As your baby grows, the amount of vitamins needed increases.

From birth, all babies, including breastfed babies, should be given a vitamin supplement containing 8.5–10 micrograms of vitamin D daily as babies' bones are growing and developing very rapidly in these early years.

From 6 months of age it is recommended that all babies should be given a supplement containing vitamins A, C and D.

Babies fed infant formula will only need vitamin supplements if they are receiving **less than 500mls** (about a pint) of infant formula a day (usually around 1 year) because infant formula has vitamins added during processing.

It is recommended that vitamin supplements are continued until the child is 5 years old. Talk to your health visitor or pharmacist about which supplement would be suitable for your baby.

It is essential that all children following a vegan diet are given supplements of vitamin B12 and riboflavin.

Healthy start

Parents who have children under 4 years or women who are pregnant and on benefits or pregnant and under 18 are entitled to Healthy Start vouchers. The free vouchers can be exchanged for milk, fruit, vegetables and infant formula. You can also get free vitamins. Visit www.healthystart.nhs.uk or ask a health professional for more information.

What if I choose to wean my baby before 6 months?

For the general population, weaning before 6 months is not recommended. However, if you choose to wean before 6 months a number of foods should be avoided as these are more likely to upset your baby or cause allergies*. Continue to breastfeed on demand or give your baby the usual amount of infant formula milk (at least 600ml or 20 fl oz).

Foods which must be avoided before 6 months:

- Foods which contain gluten, eg wheat flour, bread, breakfast cereals made from wheat, rusks, spaghetti or other pastas (eg tinned pasta in tomato sauce).
 - Nuts and seeds including peanuts.
 - Eggs.
 - Cows' milk can't be used as a drink or mixed with weaning foods at this stage.
 - Fish and shellfish.
 - Citrus fruits including citrus fruit juices, eg orange juice.
 - Soft and unpasteurised cheeses.
 - Salt
 - Sugar
 - Honey
- } see notes on page 8.
- For suitable vegetarian and vegan alternatives to meat and fish, see page 18.

* There is emerging evidence that babies who experience severe reflux, faltering growth or are at a higher risk of developing allergies may benefit from the introduction of solid foods earlier. Please seek advice from paediatrician or paediatric dietitian on safe weaning practice at this age.

If you decide to wean your baby before 6 months, start with a teaspoonful of a suitable food (see list below) mixed to a smooth, thin consistency. Offer it to your baby before or after a milk feed, or in the middle of the feed if that works better. If the food is hot, make sure you **stir it well** and **test the temperature** before giving it to your baby.

All equipment for spoon feeding must be very clean and should also be sterilised until your baby is 6 months old.

Suitable first foods:

- plain baby rice;
- puréed potato, carrot, parsnip, turnip, cauliflower;
- puréed banana, stewed fruits, eg apple, pear, apricots.

As your baby gets used to spoon feeds

As your baby gets used to taking foods from a spoon, other foods can be offered, eg:

- puréed beef, pork, lamb, chicken;
- puréed peas, green beans, lentils;
- puréed broccoli, Brussels sprouts, spinach.

If you are weaning your child on to a vegetarian diet see page 18.

Meat and poultry should be well cooked, eg in a stew, then puréed with the cooking juices. Don't add salt or stock cubes when cooking food.

Gradually increase spoon feeds to 2 to 3 times a day. The amount you give should be guided by your baby's appetite. It is important to move from puréed to mashed and more lumpy foods as your baby gets used to taking foods from a spoon.

From 6 months you need to introduce a number of other foods to ensure that your baby gets all the vitamins and minerals needed for healthy growth and development.

It is essential that you begin to introduce new foods and textures as explained in pages 7 to 14.
